## 分页配置类

1.分页查询需要添加配置类PageConfiguration

```java
package com.ishang.Configuration;

import com.baomidou.mybatisplus.extension.plugins.PaginationInterceptor;
import org.springframework.context.annotation.Bean;
import org.springframework.context.annotation.Configuration;

@Configuration
public class PageConfiguration {
    @Bean
    public PaginationInterceptor paginationInterceptor(){
        return new PaginationInterceptor();
    }
}
```

2.创建一个page对象，定义出分页的表，从第几页开始查询，每页查询几条数据

```java
//          定义分页信息
Page<OrderMaster> orderMasterPage = new Page<>(page, size);
//查询的条件
QueryWrapper queryWrapper = new QueryWrapper();
queryWrapper.eq("buyer_openid", buyerId);
Page page1 = this.orderMasterService.page(orderMasterPage, queryWrapper);
List records = page1.getRecords();
return ResultVOUtil.success(records);
```
